Order from LC or SLA ml$3.90, ph$10.80 61-19233

Trans. of Akademiya Nauk SSSR. Geofizicheskiy Institut. Trudy, 1956, no. 34(161) p. 243-268.

The analysis of seismo-acoustic processes anticipating blowouts suggests that the prognosis of the approaching moment of a blowout is possible from an acceleration of the seismo-acoustic activity of the coal seam. Moreover, the most characteristic indication of "blowout danger" of the seam is not so much the travel velocity of seismo-acoustic impulses as the amount of energy released per unit time in the fracture-forming process.
